Self Evaluation

Over the course of this project, I think I had a nice balance between learning syntax and actually coding. The beginning of the project I spent a lot of time reading *Learning Processing* and looking at the Processing website. As I continued working on it, I found myself looking up syntax less and less and spending more time coding. I feel as each push to my Github reflects this. I'm proud of my project and think I used what I learned about for, while, and custom functions effectively.

I thought learning Processing was harder than I expected. I have a little background in coding, but not much. Learning a new language takes practice and time. This was difficult when I have little time as it is. I think the most frustrating part was thinking of things I wanted my project to do, but not knowing if it is possible. It was also frustrating when I wanted to the program to do something, but it did something else. When I finally got it to work, I felt proud and excited. I'm proud of my project and I think I conveyed my adjective well. Procedural program is executed using procedures, step by step, whereas Object Oriented Programming is executed using objects. P5.js is hard to learn as it is similar to Processing but also very different. Understanding the difference in syntax is the most frustrating part.
